

AI LEARNING COURSE • 2026

Practical GenAI & RAG Engineering

For Working Professionals

Build real AI applications in weeks — not years.

For 40+ IT Professionals

The Market Reality in 2026

Demand has shifted — education has not.

Traditional AI Education

- Python & Statistics
- Machine Learning
- Deep Learning (CNN/RNN)
- Transformers & LLMs
- Then: RAG & Agents

🕒 2–3 years minimum

Your Approach

- ✦ AI App Building first
- ✦ RAG Systems
- ✦ AI Workflows & Agents
- ✦ SaaS Deployment
- ✦ Foundations — progressively

⚡ 6–12 weeks to productive

You do not need to understand how a jet engine is manufactured before learning to fly.

The same applies to AI.

Web developers use cloud services *without building data centers*

Mobile developers use APIs *without building operating systems*

Backend engineers use databases *without implementing storage engines*

AI engineers (you) use foundation models *without training them from scratch*

Top-Down AI Engineering Education

Start where the value is — not where the textbooks start.

Traditional (Bottom-Up)

Time to value: 2–3 years

Your Approach (Top-Down)

Time to value: 6–12 weeks

Your Audience's Unfair Advantage

40+ IT professionals don't start from zero — they start ahead.

Software Architecture

They understand systems, APIs, services, and how components interact — the backbone of any AI application.

Domain Knowledge

Deep enterprise expertise means they know which AI use-cases matter and which don't.

Enterprise Workflow

They've built and managed complex workflows — AI orchestration is an extension of what they already do.

Business Logic Thinking

They think in terms of outcomes and stakeholders — critical for building AI products that actually get used.

What This Program Teaches

I do NOT teach

- ✗ AI research
- ✗ Model training from scratch
- ✗ Foundational AI science
- ✗ Graduate-level mathematics
- ✗ GPU engineering

I DO teach

- ✦ AI Engineering & Integration
- ✦ AI Product Development
- ✦ RAG System Design & Build
- ✦ Applied Generative AI
- ✦ Workflow Orchestration & Agents

Traditional courses teach how AI models are built. This program teaches how AI applications are built.

The Industry Is Moving Your Way

The shift from model-building to application-building is already here.

Old AI World	→	New AI World
Train models	→	Use foundation models
Research-heavy	→	Product-heavy
Math-heavy	→	Workflow-heavy
Build models	→	Build AI systems
GPU engineering	→	AI orchestration
ML specialization	→	AI integration

A Three-Layer Learning Architecture

Build fast. Understand deeply. Go further — progressively.

Layer 1 — Build Fast

Goal: Confidence + momentum

- ▶ Prompting & Prompt Engineering
- ▶ AI APIs (OpenAI, Anthropic)
- ▶ RAG Systems
- ▶ AI Agents & Workflows
- ▶ SaaS Deployment

Layer 2 — Understand Internals

Goal: Intuition without the math

- ▶ Embeddings & Vector Databases
- ▶ Chunking Strategies
- ▶ Transformers (conceptual)
- ▶ Context Windows & Tokens
- ▶ Hallucinations & Mitigation

Layer 3 — Deep Foundations

Goal: Optional advanced path

- ▶ Machine Learning & Fine-tuning
- ▶ Attention Mechanism
- ▶ Neural Architectures
- ▶ Optimization & Training
- ▶ Model Evaluation

Most professionals need only Layers 1 & 2 to become highly productive AI engineers.

Teaching Just Enough Foundations

Practical depth — not academic depth.

Embeddings

✦ **Teach:** What they do, why they matter, how they affect retrieval quality

✗ **Skip:** *Linear algebra proofs and vector space mathematics*

Transformers

✦ **Teach:** How attention works conceptually, why it enables long-context reasoning

✗ **Skip:** *Self-attention equations and backpropagation derivations*

Chunking

✦ **Teach:** Strategies, trade-offs, and how to pick the right one for your data

✗ **Skip:** *Tokenizer internals and byte-pair encoding algorithms*

Avoid becoming 'prompt-only AI education' — but avoid academic overload. Find the productive middle.

Solving the Biggest Barrier to AI Adoption

The Old Belief

"AI is too complex for me"

"I need a computer science degree"

"I'm too old to learn this"

"It will take years to be useful"

"I don't know Python well enough"

The New Reality

"I can be productive in weeks"

"My IT experience is a headstart"

"I learn by building real things"

"My domain knowledge is valuable"

"Python is just scripting at first"

COURSE POSITIONING

"Practical GenAI & RAG Engineering for Working Professionals"

Promise: Build real AI applications in weeks — while learning essential foundations progressively.

Philosophy: Application-first AI education for experienced professionals.

Differentiator: We teach AI from the application layer downward — not from mathematics upward.

You Are on a Very Strong Direction.

The industry needs exactly what this course delivers.

- ✦ Market demand is for AI application builders — not AI researchers
- ✦ Your learners have the domain expertise that academic AI students lack
- ✦ Top-down education gets professionals productive in weeks, not years
- ✦ The shift from model-building to application-building is already here

Build. Learn. Go deep — progressively.
